AI & TECH

What matters in the AI world this week

OpenAI buys a biotech company to make AI a lab partner. OpenAI announced Tuesday it is acquiring Orchestra Bio, a startup that builds AI tools for biological research — its most direct move into life sciences yet. The deal comes the same week reports surfaced that OpenAI is raising **at least $30 billion in new funding at a roughly $1.4 trillion valuation**, a number bigger than the GDP of Switzerland. OpenAI also shipped "locked chats" in ChatGPT on October 20 and rolled out its DevDay 2026 recap with 20-plus announcements across ChatGPT, Codex, and new agent products. Anthropic wants laws that can pull a dangerous model off the market. Anthropic has begun pitching state legislators on an AI safety bill that would let regulators block a frontier model if credible analysis suggests it could cause 50 or more deaths. The proposal came the same week Anthropic told the New York City Council, under oath, that frontier AI labs are "gambling with our lives." Anthropic also published three new defenses against "distillation attacks" — where rivals copy a model's reasoning — saying the measures have cut data harvested by 90–99%. Google, OpenAI, and Anthropic are continuing to coordinate on a self-regulatory safety body called SAFA, targeted for late 2026 or early 2027. (TechCrunch / Anthropic Research)

THE TAKEAWAY

The two stories today tell the same story from opposite ends. OpenAI is buying its way into new industries at trillion-dollar scale, betting bigger is better. Anthropic is asking governments for the power to stop a model before it ships. Both moves assume the same thing: that what frontier models can do in 2026 is no longer something labs should be deciding alone.
